Effects of aging on intracellular sodium transport in cultured human sweat glands. Aging impairs response of sweat glands to cholinergic stimulants and cholinergic blocking agents. Given the role of intracellular sodium in cholinergic-induced inhibition of active sodium absorption and secretory activity, and the ability of sodium to influence the availability of cholinergic receptors for agonists and blocking agents, the present study was undertaken to determine the effects of aging on intracellular sodium transport in cultured human sweat glands. Short-circuit current and short-circuit current reversal were measured using Ussing chambers. Both the resting short-circuit current and the cholinergic-induced increase in short-circuit current were significantly greater in glands from donors 25-28 yr of age. Similar trends were observed with blocking agents and cholinergic antagonists. In contrast, the resting short-circuit current, the amiloride-induced inhibition of the cholinergic-stimulated increase in short-circuit current, and the cholinergic-induced increases in short-circuit current reversal were all significantly greater in glands from donors 19-22 yr of age. These data suggest that the age-related impairment in cholinergic responsiveness in cultured human sweat glands may be at least partially due to an increase in the apparent sodium permeability, possibly due to an alteration in the properties of a putative sodium channel or sodium-dependent, HCO₃-dependent anion transport system.

As we say goodbye for now, a special word of thanks to the peeps behind the scenes who set up the shoegazing scene in your capital city or provincial equivalent. This includes the booksellers, music retailers and bars who stocked records, and the magazines who published lyrics. There was also an invaluable role to play by the promoters, who put their sanity on the line in service of an activity that was, by its very nature, somewhat volatile (even in the context of that time).
